Abstract:

Transport's carbon emissions continue to grow and are fed by a powerful mixture of mythology, perverse subsidies, poor quality spatial planning and streets that prioritise the car and deter the pedestrian and the cyclist. The time has now arrived when we must move on from analysis and demonstrate clearly that a low carbon transport future is possible, desirable and deliverable. More than this it will assist with local economic development, improvements to air quality, noise reduction, reduced obesity and a resurgence of community life and supportive neighbourhoods. The presentation will describe a simple, attractive and effective plan to produce at least an 80% reduction in transport's carbon emissions by 2050.
